## **REPLACING**

**METAL JACKETING AND FIBERGLASS CAUSING  
CORROSION AND NO EFFICIENCY**

**Problem:** Starch and water falling into fiberglass insulation against the hot surface and catching on fire or charring.

**Solution:** Remove metal jacket and fiberglass, clean surface and spray HPC directly over operating hot surface to 500 mils (13mm) dropping the surface temperature from 230 F (110C) down to 87 F (30.6C).

HPC with a top coat of SP SEAL COAT gives a dry insulation with a water barrier surface for efficient insulation and performance.
